 7. Challenges and Maintenance
 8. Limitations and Future Scope
 9. Conclusion
- Appendix A: Project Components

1. Project Overview

SwiftShip Tracker is a Salesforce-based parcel management and tracking solution. It centralizes parcel, sender, receiver and delivery information so that booking, tracking, delivery updates and customer communication can be managed from one system.

The project uses Salesforce custom objects, Flows, Prompt Builder and AgentForce AI. Customers can track parcel information, while delivery agents can update parcel status. Reports and dashboards support operational monitoring.

Main Components

- Custom objects: Parcel, Delivery, Sender and Receiver.
- Standard Salesforce objects used where required for supporting records and communication.
- Flows for parcel operations, status updates and notifications.
- Prompt Builder and AgentForce AI for conversational parcel tracking.
- Experience Cloud for customer-facing access.
- Reports and dashboards for operational visibility.

2. Objectives

- Centralize parcel and customer information in Salesforce.
- Simplify parcel booking and delivery tracking.
- Provide clear shipment status and estimated delivery information.
- Automate important parcel updates and customer notifications.
- Allow delivery agents to update parcel status efficiently.
- Provide AI-assisted parcel tracking through AgentForce.
- Provide reports and dashboards for operational monitoring.
- Use role-based and field-level access to protect data.

Project Scope

- Support the parcel lifecycle from booking through delivery confirmation.
- Manage sender, receiver, parcel and delivery information.
- Use automation and AI to reduce repetitive manual work.
- Provide customer self-service and conversational tracking support.

3. Problem Statement and Requirements

Customers may need to contact support or use multiple applications to book and track parcels. Delivery agents may also need manual handling for status updates, while administrators need centralized information to monitor parcel operations.

Functional Requirements

FR-1	Parcel booking and record creation
FR-2	Parcel status tracking
FR-3	Weight management
FR-4	Estimated delivery date management
FR-5	Sender information management
FR-6	Receiver information management
FR-7	Delivery and current-location tracking
FR-8	Agent parcel status updates
FR-9	Automated customer notifications
FR-10	AI-powered parcel tracking
FR-11	Reports and dashboards
FR-12	Customer access through Experience Cloud

Non-Functional Requirements

- Usability: simple Salesforce and customer-facing experience.
- Security: role-based and field-level access control.
- Reliability: accurate parcel and delivery information.
- Performance: timely Flow and AgentForce responses.
- Scalability: support growing parcel operations.
- Data integrity and maintainability through controlled configuration.

4. Project Planning

Development Approach

- Requirement analysis and user-need identification.
- Data model design for Parcel, Delivery, Sender and Receiver.
- Salesforce configuration and automation.
- Prompt Builder and AgentForce setup.
- Testing of Flow execution, data retrieval and status updates.
- Documentation and maintenance planning.

Core User Journey

Parcel Booking → Record Creation → Dispatch & Shipment → In-Transit Tracking → Out for Delivery → Delivery Confirmation → Customer Notification → Feedback / Support.

Data Flow

Customer / Sender → Parcel Booking → Parcel Record → Sender + Receiver → Delivery Record → Status Update → Current Location & Estimated Delivery → Notifications → Customer Tracking / AgentForce → Reports & Dashboards.

AI Tracking Flow

Customer Query → AgentForce AI → Prompt Builder → Parcel Record → Status / Weight / Estimated Delivery → Conversational Response.

5. Implementation

5.1 Salesforce Setup

The project is implemented in a Salesforce Developer Edition environment using Lightning Experience. The main configuration includes custom objects, relationships, automation, security, reporting and AI.

Figure 1: Salesforce setup / application screen

5.2 Data Model

Object	Purpose
Parcel__c	Stores parcel and shipment information.
Delivery__c	Stores delivery and delivery-status information.
Sender__c	Stores sender details.
Receiver__c	Stores receiver details.

A screenshot of the Salesforce Object Manager for the 'Parcel' object. The left sidebar shows navigation options like 'Details', 'Fields & Relationships', 'Page Layouts', etc. The main area displays a table of fields and their relationships. The table has columns for the field name, the API name, and the data type. The 'Owner' field is highlighted, showing a relationship to 'User' with a checkmark in the 'Field Dependencies' column. Other fields include 'Created By', 'Estimated Delivery', 'Last Modified By', 'Parcel ID', 'Parcel Name', 'Sender', 'Status', and 'Weight'.

Fields & Relationships	Created By	Estimated Delivery	Last Modified By	Owner	Parcel ID	Parcel Name	Sender	Status	Weight
9 Items, Sorted by Field Label	CreatedById	Estimated_Delivery__c	LastModifiedById	OwnerId	Parcel_ID__c	Name	Sender__c	Status__c	Weight__c
	Lookup(User)	Date	Lookup(User)	Lookup(User,Group)	Auto Number	Text(80)	Lookup(Sender)	Picklist	Number(18, 0)

Figure 2: Parcel Data Model / Fields

5.3 Automation

Salesforce Flow is used to automate parcel operations and delivery updates. The SwiftShip Tracker Flow handles parcel input, retrieves parcel details, and supports status update or confirmation actions.

Figure 2: SwiftShip Tracker Flow

5.4 AgentForce and Prompt Builder

AgentForce provides conversational support for parcel-related questions. Prompt Builder is used to retrieve parcel information such as Parcel ID, Status, Weight and Estimated Delivery Date.

Figure 3: AgentForce / Prompt Builder configuration

5.5 Security

- Permission sets are used to provide the required object access.
- Parcel, Delivery, Sender and Receiver access is configured according to user responsibilities.
- AgentForce users require the appropriate SwiftShip permission set.
- Role-based and field-level access are part of the project security approach.

6. Testing

Testing is performed in the Salesforce Developer Org to verify AgentForce topic recognition, Flow execution, parcel data retrieval and status updates.

Test	Expected Result
Open Parcel Tracking Agent	Agent is available and configured.
Check assigned topic	Parcel-related topic and SwiftShip Tracker action are linked.
Check Flow	SwiftShip Tracker Flow is activated.
Track parcel	Parcel details are returned for the supplied Parcel ID.
Update delivery status	Status is updated and a confirmation is returned.
Validate Salesforce record	Parcel record reflects the expected change.

The screenshot displays the Agentforce Builder interface for testing the 'Parcel Tracker' agent. The top bar shows 'Agentforce Builder' and 'SwiftShip Tracker Version 1 (Active)'. The left sidebar contains an 'Explorer' with a search bar and a list of settings and subagents. The main area is divided into a 'Live Test' chat window and an 'Agent Preview Details' panel. The chat window shows a user asking for parcel details for ID P002, and the agent responding with the details. The Agent Preview Details panel shows the flow of the conversation, including input, reasoning, and action steps.

Figure 6: AgentForce testing / response

7. Challenges and Maintenance

Challenges / Checks

- Agent topics and actions must be correctly connected to the intended Flow.
- Parcel and delivery data must remain accurate and available to the agent.
- Permissions must allow the required records and actions.
- Flow failures or configuration issues may require troubleshooting.

Maintenance

- Monitor failed Flow executions and incorrect agent routing.
- Review AgentForce responses and refine prompts when required.
- Update Flow logic when parcel processes change.
- Keep parcel, customer and delivery information accurate and synchronized.

8. Limitations and Future Scope

Limitations

- The project is implemented and tested in a Salesforce Developer Org.
- Production UAT, sandbox deployment and enterprise CI/CD are outside the project scope.
- AgentForce responses depend on correct prompts, topics and available Salesforce data.
- External logistics integrations can increase implementation complexity.

Future Scope

- Extend AgentForce for more parcel-management queries.
- Improve real-time delivery tracking.
- Expand Experience Cloud self-service features.
- Add advanced delivery-performance analytics.
- Integrate additional external logistics systems.
- Improve AI prompts and conversational experiences.
- Introduce enterprise-level sandbox and CI/CD deployment.
- Expand automation for additional parcel operations.

9. Conclusion

SwiftShip Tracker demonstrates how Salesforce can be used to build a centralized parcel management and tracking solution. The project combines custom objects, relationships, Flows, AgentForce AI, Prompt Builder, security controls, Experience Cloud and reporting to support parcel booking, delivery tracking, status updates and customer communication.

The integration of AgentForce AI with Prompt Builder and Salesforce Flow provides a conversational approach to parcel tracking, allowing customers to obtain shipment information without depending entirely on manual support.

Figure 7: Final project / dashboard screenshot

Appendix A: Project Components

Area	Components
Custom Objects	Parcel, Delivery, Sender, Receiver
Standard Objects	Account, Contact, Case, Task, EmailMessage, User
Automation	Flows, Approval Processes, Email Alerts
Apex	Apex Classes, Batch Apex
AI	AgentForce AI, Prompt Builder
UI	Lightning App, Lightning Record Pages, Experience Cloud
Security	Profiles, Roles, Permission Sets, Sharing Rules, Field-Level Security
Analytics	Reports and Dashboards
Testing	Flow, AgentForce, data retrieval, security and permission validation

Thank You
